OVERVIEW

PROBLEM

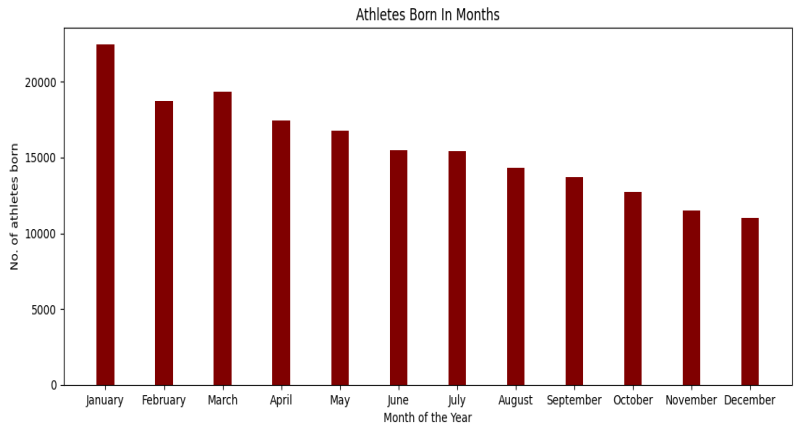
The purpose of the project is to look at the data to see what month of birth is the most common in professional soccer players.

DATA

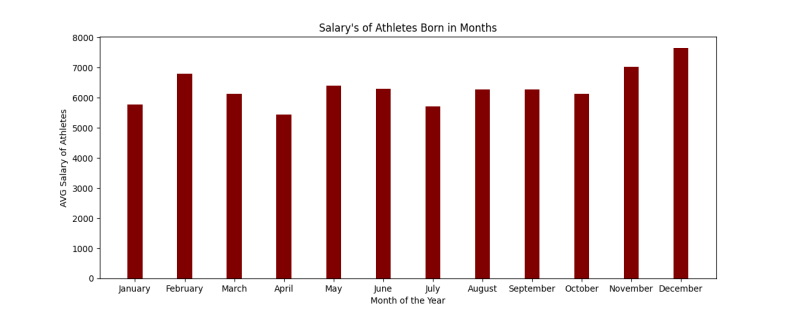
The data was in a csv file with over 180,000 lines. I chose it because it had all the data I needed and it was easy to access.

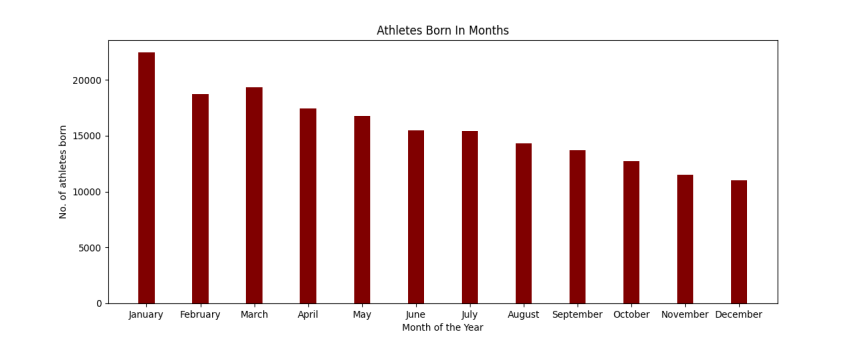
DESIGN

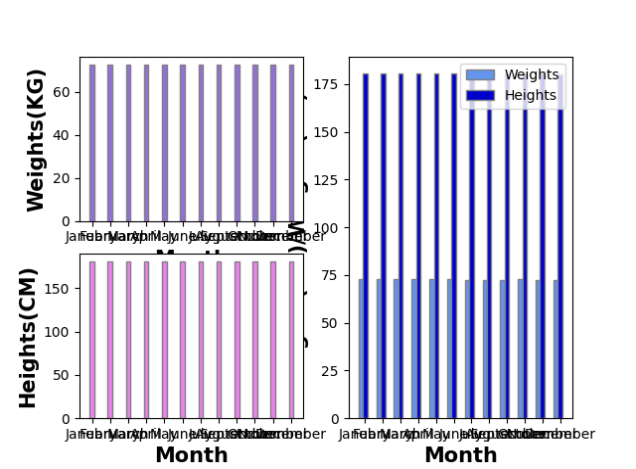
I have three tables to represent the data: basic information about the athlete, biometric data, and salary data.

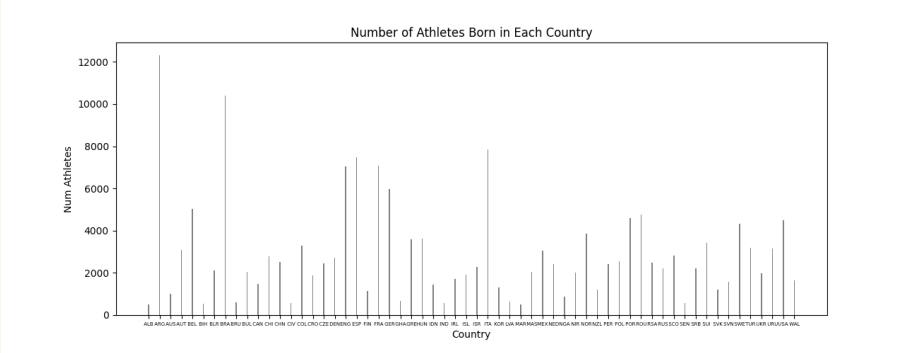


DATA









DATA SOURCE

Kaggle: https://www.kaggle.com/datasets/ultimus/football-wages-prediction

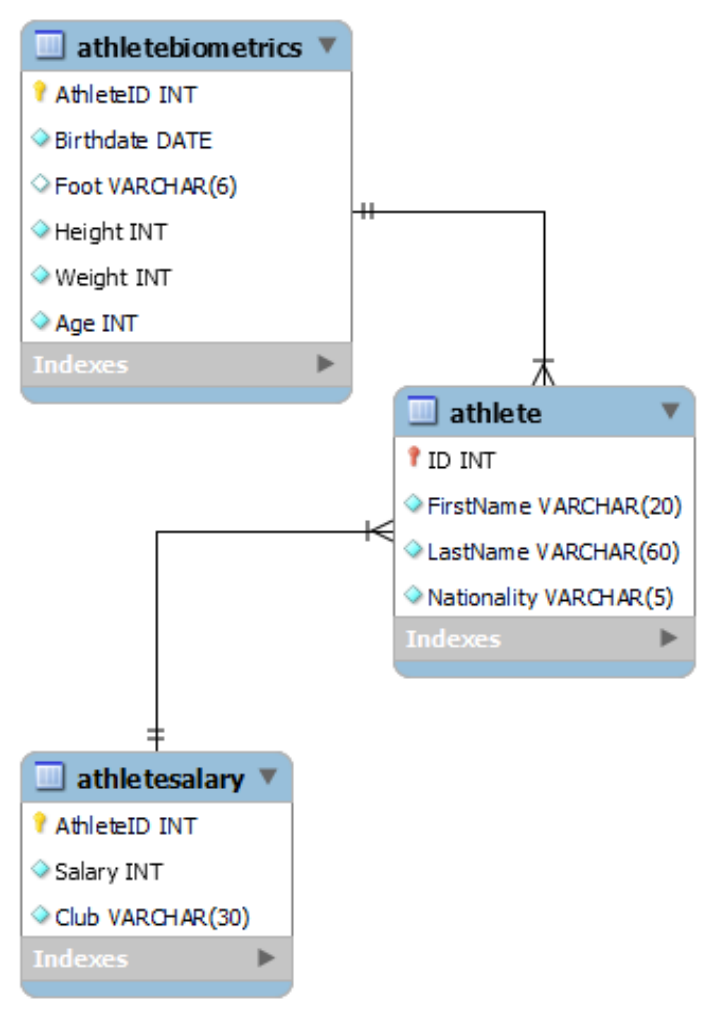
DATA PROCESSING

Reviewed data, had to parse month and salary info, as well as separate the first and last name because they were in one column.

LESSONS LEARNED

That having one source for your data makes it a lot easier to process the data with code.

ANALYSIS



ENTITIES, RELATIONSHIPS, ATTRIBUTES

My only entity was the Athlete. It the attributes of: Name(First and Last), Birthdate, Preferred foot, Salary, ID, Height, and Weight.

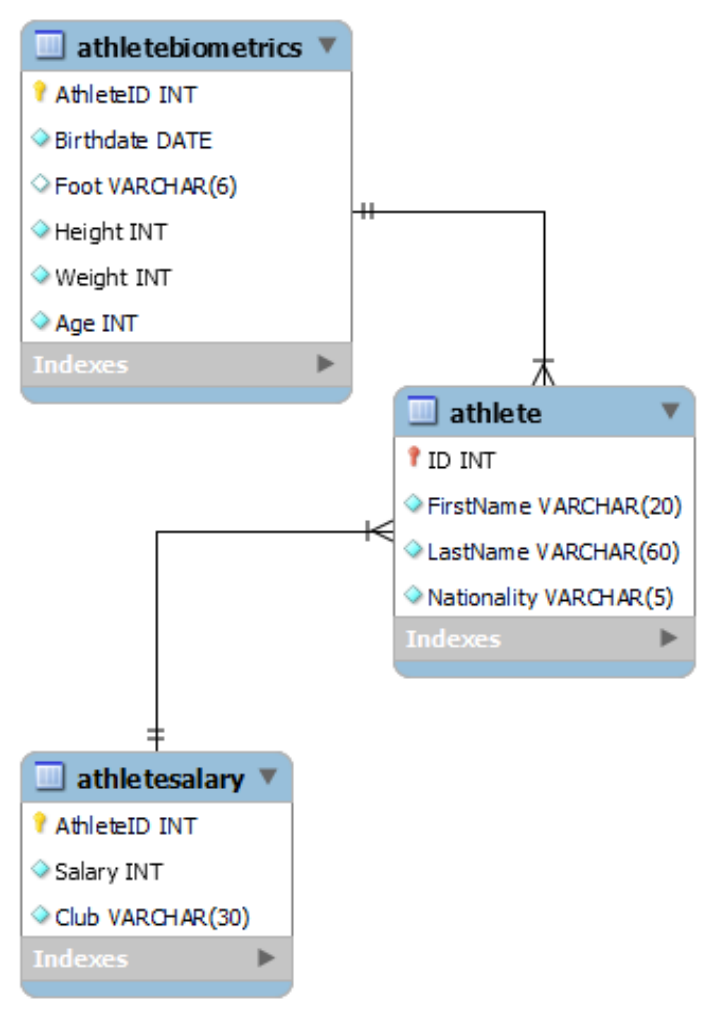
CARDINALITY

Every Athlete had to have a name, birthdate, height, and weight otherwise they wouldn't be a person. ID was unique to each player and the preferred foot could be either Right, Left, or Either.

STRONG AND WEAK ENTITIES

Since my only Entity was the Athlete they were a strong entity and had an ID attribute.

LOGICAL DESIGN



IMPLEMENT ENTITIES

Athlete: Basic information

Athlete Biometrics: Height, Weight, Foot

Athlete Salary: Salary

IMPLEMENT RELATIONSHIPS

Athlete Biometrics and Athlete Salary were related to Athlete by an AthleteID

APPLY NORMAL FORM

Didn't have to because nothing was based off of anything except the AthleteID which was the primary key. Second Normal Form

LESSONS LEARNED

That having a simple schema for your database makes it a lot easier to manage.

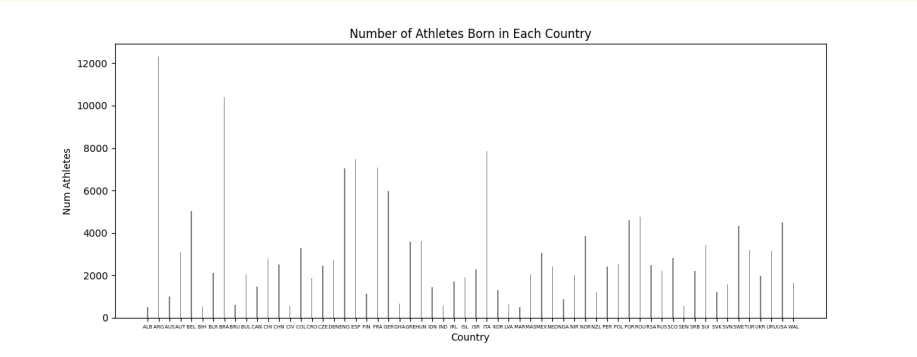
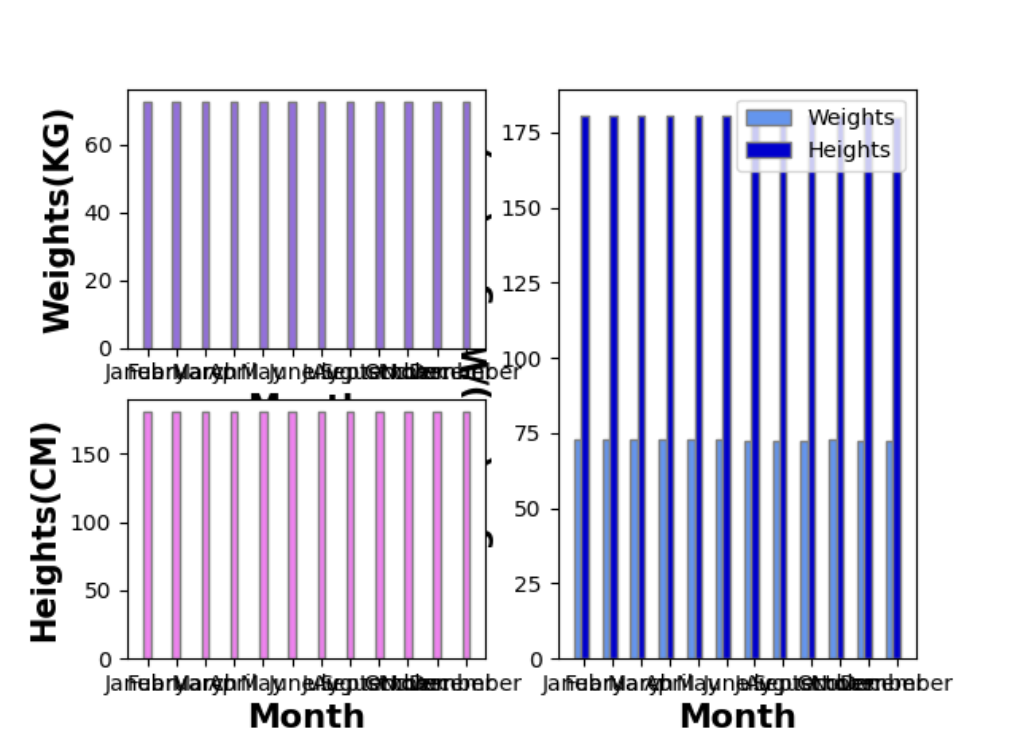
RESULTS





LESSONS LEARNED

Keep the problem clear and simple. Makes understanding the queries and finding data easier.

CONCLUSION

- To be born in January in Argentina means you have a good chance of being a pro. But being born later in the year means you have a good chance to earn more.
- The process of building a database, to keep the question/problem clear and concise, finding data that's formatted close to what you need makes it easier.
- What would you do if you had extra time? -> expand to see positions and clubs and maybe other sports.
